Genome projects are scientific endeavours that ultimately aim to determine the complete genome sequence of an organism (be it an animal, a plant, a fungus, a bacterium, an archaean, a protist or a virus) and to annotate protein-coding genes and other important genome-encoded features. The genome sequence of an organism includes the collective DNA sequences of each chromosome in the organism.

Brain mapping based on the regional distribution of cortical areas is a valuable concept beyond the generation of an atlas. It is a way to understand cortical organization by integrating in vivo structural and functional imaging data and post mortem high-resolution cytoarchitectonic observations in a common reference space (Amunts et al., 2007, Amunts et al., 2014b, Mazziotta et al., 2001 ...
