A covalent bond, also called a molecular bond, is a chemical bond that involves the sharing of electron pairs between atoms. These electron pairs are known as shared pairs or bonding pairs, and the stable balance of attractive and repulsive forces between atoms, when they share electrons, is known as covalent bonding. For many molecules, the sharing of electrons allows each atom to attain the ...

Protein structure determination. In terms of the accuracy of protein structure determinations, all of the bond lengths are invariant. Bond angles are also essentially invariant, except perhaps for the backbone N-C α -C angle. The α -carbon is tetrahedral, which would give 110°, but there are indications from accurately refined protein structures (Deisenhofer and Steigemann, 1975 ...

14.3. HYDRIDES. 14.3.1. Bonding in the hydrides shows changes across the period which are largely predictable from the increase in effective nuclear charge. The changes lag slightly behind in the

third period because the extra shell reduces attraction of the nucleus for electrons in the outer shell.

This is the most important fact about chemical bonding that you should know, but it is not of itself a workable theory of bonding because it does not describe the conditions under which bonding occurs, nor does it make useful predictions about the properties of the bonded atoms.. Our views of what constitutes chemical bonding are still evolving, according to a 2007 article in Chemical and ...
