Added an answer. Try setting up your medium and bubbling carbon dioxide through it. The pH will drop to around the pKa for carbon dioxide (around 6.1). At this pH around 50 % of all the carbon dioxide will be the carbonate anion. This is also a low enough pH to keep most of the transition element carbonates in solution.

5 Answers. As LE is proportional to the charges of its ions, for calcium carbonate, its LE would be roughly  $4\times$  the LE of sodium chloride.  $\text{CaCO}_3(\text{s}) \rightarrow \text{Ca}^{2+}(\text{g}) + \text{CO}_3^{2-}(\text{g})$  This value is always positive, as energy is required to separate the ions.
