Temperature coupled with oxygen is the most commonly used accelerative condition for polymer degradation as it is easy to apply. It is also an integral part of most other exposure conditions (i.e. photo-oxidation), as is schematically shown in Fig. 1. Materials which do not 'age well' are commonly exposed to hotter temperatures until they may 'fall apart.'

That said, as explained in Chapter 3, the requisite material properties that are to be optimized cannot be measured by the usual quasi-static measures of mechanical behavior. However, even at lower strain rates, conducting mechanical tests at small scale—that is, at the microstructural level, on the order of nanometers or microns—will likely shed light on ...
